

NFT-MAKER PRO Uploader

ShelterPets

shelterpetscnft.com @ShelterPetsCNFT

How to run the script:

1. Install a recent version of python.
2. Download NFTMAKERUPLOADER.py
3. Open terminal or anaconda prompt.
4. Navigate to the location of NFTMAKERUPLOADER.py.
5. Configure your layers in the proper format.
 - (a) Create a Layers folder, where each subfolder inside are the header values for your metadata (background, breed, eyes, etc). Inside the subfolder include all of the images with file names that correspond to their metadata values (Blue, Orange Tabby, Blue, etc). Nothing else should be in this layers folder.

- (b) Note the folder location (for example C:/Users/admin/Desktop/ShelterPets/Layers) as this will be an input into the program.

6. Make a folder location for the program to output your compiled NFT images. Do not put the layers inside this output folder.
7. Obtain your NFT-MAKER PRO API key by going to your NFT-MAKER account and generating an api key. Must have the ability to upload and create projects.

Create new Apikey

Create Apikey

8. Run NFTMAKERUPLOADER.py.
9. Any typos or extra spaces will cause the program to fail
10. Make sure all words are spelled correct and the correct case is used.
11. Input layers from back to front to correctly generate the images.
12. Prompt asking for constant metadata values is asking for the likes of Project or Artist which would appear on all NFTs.

13. Result of an uploaded NFT can be seen below
